

WORKFLOW OVERVIEW

This workflow automatically fetches Google Maps business data from SERP API and writes it to a Google Sheet.

Flow:

1. Manual Trigger – Starts the workflow manually.
2. Query Node – Defines search terms (locations or business types).
3. Split Out – Splits each query to be processed one by one.
4. SerpApi Node – Fetches business results for each query.
5. Loop Over Items – Processes each result individually.
6. Code Node (JavaScript) – Extracts and formats details such as name, rating, address, etc.
7. Append/Update Sheet Node – Saves each record in Google Sheets.

HOW TO EDIT THE QUERIES

Step 1: Open Query Node

1. Click on the **Query Node** in the workflow.
2. Under **Fields to Set → Add Value**, you'll see a list similar to:

```
[  
  "laverie pas de calais",  
  "laverie nord"  
]
```

Step 2: Add or Edit Queries

- To add a new query:

```
[  
  "laverie pas de calais",  
  "laverie nord", ///A new comma was added before adding the new query below  
  "new query added"  
]
```

- To remove a query, delete the corresponding line.
- Make sure you add a comma to the pre-existing query before adding your new query.

Each query represents one SERP API search. You can include any keyword + location combination.

HOW IT RUNS

1. The workflow starts when **Execute Workflow** is clicked.
2. It reads all queries from the Query Node.
3. Each query is split and processed individually.
4. SERP API fetches the business data.
5. The Code Node extracts and structures the details.
6. The results are appended automatically to the target Google Sheet.

GOOGLE SHEETS OUTPUT

Each row contains the following fields:
Name | Type | Rating | Reviews | Address | Website | Hours | Phone | Thumbnail |
Query | Timestamp

The workflow automatically appends data to the sheet. No duplicates occur unless the same query is re-run.
